

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Fishes from Lake Como, Wisconsin, October 11th &
28th, 1910.

Ameiurus natalis [Le Sueur] (3); *Notemigonus chrysoleucas* [Mitchill] (3).

It is probable that collections at other seasons in these localities would show many other species as well as different relative numbers of the species found.

ALFRED C. WEED,
Smithsonian Institution, D. C.

1920 FISH RECORDS FROM ORIENT,
LONG ISLAND

In this brief list only data that seems of special interest is given.

Carcharhinus obscurus. Dusky Shark. One 30 inches in total length captured on November 1st, from the Sound, is my latest date for the species.

Carcharias littoralis. Sand Shark. One June 28th, 3 feet in total length, from Gardiner's Bay.

Squalus acanthias Spined Dogfish. Several adults were taken in July and August. This is the first record of the adults in midsummer, although the young are frequently abundant at that season. It was discovered that the adults were common on the deep-water ledges in the Sound in August at the time the young were entering the traps by thousands. Many of these young were only a few hours old.

Raja eglanteria. Clear-nosed Skate. One adult, November 1st.

Dasyatis centrura. Sting Ray. One half-grown individual on September 27th. In former years it was abundant in the Sound and Gardiner's Bay. It is at present very rare and irregular.

Anchoviella brownii. Striped Anchovy. A specimen $5\frac{7}{8}$ inches in total length was taken on June 15th. It was common on June 17th.

Anchoviella mitchilli. Common Anchovy. Taken on June 11th, when it was common.

Leiostomus xanthurus. Lafayette. The arrival of this species was much earlier than usual and it was very common throughout the season. The first was taken on May 19th (three adults).

Trachurus lathami. Gascon. Five specimens of this rare species were collected during October. The first was taken on the 8th and the last on the 29th. Two were taken on the 15th. These ranged from 5 to $6\frac{1}{4}$ inches in total length. October 29th is the latest date it has been recorded near Orient, and $6\frac{1}{4}$ inches is the largest specimen obtained.

Lagocephalus laevigatus. Rabbit-fish. One November 5th, 8 inches in total length.

Scomber colias. Thimble Mackerel. First were taken on July 5th, which seems to be my earliest date for them. They appeared common on this date, specimens being 4 to 5 inches in length.

Chilomycterus schoepfi. Spiny Swellfish. Three adults were taken. The first on June 30th was $9\frac{1}{4}$ inches in length. The other two, both 8 inches in length, were taken on the 8th and 16th of July.

Hemitripterus americanus. Sea Raven. One June 28th is the latest local record.

Gadus callarias. Cod. One June 7th (weight 19 lbs.). This is the latest record for an adult.

ROY LATHAM,
Orient, N. Y.

A LIST OF AMPHIBIA AND REPTILIA COLLECTED IN INDIANA.

The following species of Amphibia and Reptilia were collected in Indiana from September 14 to October 12, 1920. The writer was with Mr. Charles C. Deam, State Forester, who was engaged in official work. All of the specimens mentioned are now either in the Museum of Zoology, University of Michigan, or in the writer's private collection.

Plethodon cinereus (Green).—Wayne Co., 4 miles
